QUINAZOLINE DERIVATIVES AS ANTITUMOR AGENTS

The invention concerns certain novel quinazoline derivatives, or
5 pharmaceutically-acceptable salts thereof, which possess anti-tumour activity and are
accordingly useful in methods of treatment of the human or animal body. The invention also
concerns processes for the manufacture of said quinazoline derivatives, to pharmaceutical
compositions containing them and to their use in therapeutic methods, for example in the
manufacture of medicaments for use in the prevention or treatment of solid tumour disease in
10 a warm-blooded animal such as man.

Many of the current treatment regimes for diseases resulting from the abnormal
regulation of cellular proliferation such as psoriasis and cancer, utilise compounds that inhibit
DNA synthesis and cellular proliferation. To date, compounds used in such treatments are
generally toxic to cells however their enhanced effects on rapidly dividing cells such as
15 tumour cells can be beneficial. Alternative approaches to these cytotoxic anti-tumour agents
are currently being developed, for example selective inhibitors of cell signalling pathways.
These types of inhibitors are likely to have the potential to display an enhanced selectivity of
action against tumour cells and so are likely to reduce the probability of the therapy possessing
unwanted side effects.

20 Eukaryotic cells are continually responding to many diverse extracellular signals that
enable communication between cells within an organism. These signals regulate a wide
variety of physical responses in the cell including proliferation, differentiation, apoptosis and
motility. The extracellular signals take the form of a diverse variety of soluble factors
including growth factors as well as paracrine and endocrine factors. By binding to specific
25 transmembrane receptors, these ligands integrate the extracellular signal to the intracellular
signalling pathways, therefore transducing the signal across the plasma membrane and
allowing the individual cell to respond to its extracellular signals. Many of these signal
transduction processes utilise the reversible process of the phosphorylation of proteins that are
involved in the promotion of these diverse cellular responses. The phosphorylation status of
30 target proteins is regulated by specific kinases and phosphatases that are responsible for the
regulation of about one third of all proteins encoded by the mammalian genome. As
phosphorylation is such an important regulatory mechanism in the signal transduction process,
it is therefore not surprising that aberrations in these intracellular pathways result in abnormal

cell growth and differentiation and so promote cellular transformation (reviewed in Cohen *et al*, Curr Opin Chem Biol, 1999, 3, 459-465).

It has been widely shown that a number of these tyrosine kinases are mutated to constitutively active forms and/or when over-expressed result in the transformation of a variety of human cells. These mutated and over-expressed forms of the kinase are present in a large proportion of human tumours (reviewed in Kolibaba *et al*, Biochimica et Biophysica Acta, 1997, 133, F217-F248). As tyrosine kinases play fundamental roles in the proliferation and differentiation of a variety of tissues, much focus has centred on these enzymes in the development of novel anti-cancer therapies. This family of enzymes is divided into two groups - receptor and non-receptor tyrosine kinases e.g. EGF Receptors and the SRC family respectively. From the results of a large number of studies including the Human Genome Project, about 90 tyrosine kinase have been identified in the human genome, of this 58 are of the receptor type and 32 are of the non-receptor type. These can be compartmentalised in to 20 receptor tyrosine kinase and 10 non-receptor tyrosine kinase sub-families (Robinson *et al*, Oncogene, 2000, 19, 5548-5557).

The receptor tyrosine kinases are of particular importance in the transmission of mitogenic signals that initiate cellular replication. These large glycoproteins, which span the plasma membrane of the cell possess an extracellular binding domain for their specific ligands (such as Epidermal Growth Factor (EGF) for the EGF Receptor). Binding of ligand results in the activation of the receptor's kinase enzymatic activity that is encoded by the intracellular portion of the receptor. This activity phosphorylates key tyrosine amino acids in target proteins, resulting in the transduction of proliferative signals across the plasma membrane of the cell.

It is known that the erbB family of receptor tyrosine kinases, which include EGFR, erbB2, erbB3 and erbB4, are frequently involved in driving the proliferation and survival of tumour cells (reviewed in Olayioye *et al*, EMBO J, 2000, 19, 3159). One mechanism in which this can be accomplished is by overexpression of the receptor at the protein level, generally as a result of gene amplification. This has been observed in many common human cancers (reviewed in Klapper *et al*, Adv. Cancer Res., 2000, 77, 25) such as breast cancer (Sainsbury *et al*, Brit. J. Cancer, 1988, 58, 458; Guerin *et al*, Oncogene Res., 1988, 3, 21; Slamon *et al*, Science, 1989, 244, 707; Klijn *et al*, Breast Cancer Res. Treat., 1994, 29, 73 and reviewed in Salomon *et al*, Crit. Rev. Oncol. Hematol., 1995, 19, 183), non-small cell lung cancers (NSCLCs) including adenocarcinomas (Cerny *et al*, Brit. J. Cancer, 1986, 54,

265; Reubi *et al.*, Int. J. Cancer, 1990, 45, 269; Rusch *et al.*, Cancer Research, 1993, 53, 2379; Brabender *et al.*, Clin. Cancer Res., 2001, 7, 1850) as well as other cancers of the lung (Hendler *et al.*, Cancer Cells, 1989, 7, 347; Ohsaki *et al.*, Oncol. Rep., 2000, 7, 603), bladder cancer (Neal *et al.*, Lancet, 1985, 366; Chow *et al.*, Clin. Cancer Res., 2001, 7, 1957, Zhau *et al.*, Mol Carcinog., 3, 254), oesophageal cancer (Mukaida *et al.*, Cancer, 1991, 68, 142), gastrointestinal cancer such as colon, rectal or stomach cancer (Bolen *et al.*, Oncogene Res., 1987, 1, 149; Kapitanovic *et al.*, Gastroenterology, 2000, 112, 1103; Ross *et al.*, Cancer Invest., 2001, 19, 554), cancer of the prostate (Visakorpi *et al.*, Histochem. J., 1992, 24, 481; Kumar *et al.*, 2000, 32, 73; Scher *et al.*, J. Natl. Cancer Inst., 2000, 92, 1866), leukaemia (Konaka *et al.*, Cell, 1984, 37, 1035, Martin-Subero *et al.*, Cancer Genet Cytogenet., 2001, 127, 174), ovarian (Hellstrom *et al.*, Cancer Res., 2001, 61, 2420), head and neck (Shiga *et al.*, Head Neck, 2000, 22, 599) or pancreatic cancer (Ovotny *et al.*, Neoplasma, 2001, 48, 188). As more human tumour tissues are tested for expression of the erbB family of receptor tyrosine kinases it is expected that their widespread prevalence and importance will be further enhanced in the future.

As a consequence of the mis-regulation of one or more of these receptors (in particular erbB2), it is widely believed that many tumours become clinically more aggressive and so correlate with a poorer prognosis for the patient (Brabender *et al.*, Clin. Cancer Res., 2001, 7, 1850; Ross *et al.*, Cancer Investigation, 2001, 19, 554, Yu *et al.*, Bioessays, 2000, 22.7, 673). In addition to these clinical findings, a wealth of pre-clinical information suggests that the erbB family of receptor tyrosine kinases are involved in cellular transformation. This includes the observations that many tumour cell lines overexpress one or more of the erbB receptors and that EGFR or erbB2 when transfected into non-tumour cells have the ability to transform these cells. This tumourigenic potential has been further verified as transgenic mice that overexpress erbB2 spontaneously develop tumours in the mammary gland. In addition to this, a number of pre-clinical studies have demonstrated that anti-proliferative effects can be induced by knocking out one or more erbB activities by small molecule inhibitors, dominant negatives or inhibitory antibodies (reviewed in Mendelsohn *et al.*, Oncogene, 2000, 19, 6550). Thus it has been recognised that inhibitors of these receptor tyrosine kinases should be of value as a selective inhibitor of the proliferation of mammalian cancer cells (Yaish *et al.*, Science, 1988, 242, 933, Kolibaba *et al.*, Biochimica et Biophysica Acta, 1997, 133, F217-F248; Al-Obeidi *et al.*, 2000, Oncogene, 19, 5690-5701; Mendelsohn *et al.*, 2000, Oncogene, 19, 6550-6565). In addition to this pre-clinical data, findings using inhibitory

- 4 -

antibodies against EGFR and erbB2 (c-225 and trastuzumab respectively) have proven to be beneficial in the clinic for the treatment of selected solid tumours (reviewed in Mendelsohn *et al.*, 2000, Oncogene, 19, 6550-6565).

Amplification and/or activity of members of the ErbB type receptor tyrosine kinases
5 have been detected and so have been implicated to play a role in a number of non-malignant proliferative disorders such as psoriasis (Ben-Bassat, Curr. Pharm. Des., 2000, 6, 933; Elder *et al.*, Science, 1989, 243, 811), benign prostatic hyperplasia (BPH) (Kumar *et al.*, Int. Urol. Nephrol., 2000, 32, 73), atherosclerosis and restenosis (Bokemeyer *et al.*, Kidney Int., 2000, 58, 549). It is therefore expected that inhibitors of erbB type receptor tyrosine kinases will be
10 useful in the treatment of these and other non-malignant disorders of excessive cellular proliferation.

International Patent Applications WO 96/33977, WO 96/33978, WO 96/33979, WO 96/33980 and WO 96/33981 disclose that certain quinazoline derivatives which bear an anilino substituent at the 4-position possess receptor tyrosine kinase inhibitory activity.

15 A review of the structure activity relationship of various quinazoline derivatives is disclosed by G. W. Rewcastle *et al.* (J. Med. Chem. 1995, 38, 3428-3487), including a number of 5-substituted compounds. However, such 5-substituted compounds are stated to have low in-vitro activity as EGFR tyrosine kinase inhibitors compared to quinazolines substituted at the 6- and 7- positions.

20 WO 96/09294 discloses 4-anilinoquinazoline derivatives, including 5-chloro and 5-methoxy substituted quinazoline derivatives as protein tyrosine kinase inhibitors.

Co-pending International Patent Application PCT/GB01/02424 discloses that certain quinazoline derivatives which carry a 5-substituent are inhibitors of the Src family of non-receptor tyrosine kinases, such as c-Src, c-Yes and c-Fyn.

25 We have now found that surprisingly certain 5-substituted quinazoline derivatives possess potent anti-tumour activity. Without wishing to imply that the compounds disclosed in the present invention possess pharmacological activity only by virtue of an effect on a single biological process, it is believed that the compounds provide an anti-tumour effect by way of inhibition of one or more of the erbB family of receptor tyrosine kinases that are
30 involved in the signal transduction steps which lead to the proliferation of tumour cells. In particular, it is believed that the compounds of the present invention provide an anti-tumour effect by way of inhibition of EGFR and/or erbB2 receptor tyrosine kinases.

- 5 -

Generally the compounds of the present invention possess potent inhibitory activity against the erbB receptor tyrosine kinase family, for example by inhibition of EGFR and/or erbB2 and/or erbB4 receptor tyrosine kinases, whilst possessing less potent inhibitory activity against other kinases. Furthermore, generally the compounds of the present invention possess

5 substantially better potency against the erbB2 over that of the EGFR tyrosine kinase, thus potentially providing effective treatment for erbB2 driven tumours. The invention also includes compounds that are active against all or a combination of EGFR, erbB2 and erbB4 receptor tyrosine kinases, thus potentially providing treatments for conditions mediated by one or more of these receptor tyrosine kinases.

However references to individual alkyl groups such as "propyl" are specific for the straight-chain

version only, references to individual branched-chain alkyl groups such as "isopropyl" are specific for the branched-chain version only and references to individual cycloalkyl groups such as "cyclopentyl" are specific for that 5-membered ring only. An analogous convention applies to other generic terms, for example (1-6C)alkoxy includes methoxy, ethoxy, cyclopropyloxy and cyclopentyloxy, (1-6C)alkylamino includes methylamino, ethylamino, cyclobutylamino and cyclohexylamino, and di-[(1-6Calkyl)amino includes dimethylamino, diethylamino, N-cyclobutyl-N-methylamino and N-cyclohexyl-N-ethylamino.

When in this specification reference is made to a (1-4C)alkyl group it is to be understood that such groups refer to alkyl groups containing up to 4 carbon atoms. A skilled person will realise that representative examples of such groups are those listed above under (1-6C)alkyl that contain up to 4 carbon atoms, such as methyl, ethyl, propyl and butyl. A similar convention is adopted for the other groups listed above such as (1-4C)alkoxy; (2-4C)alkenyl, (2-4C)alkynyl and (2-4C)alkanoyl.

When, as defined hereinbefore, in the group of the formula $-X^2-Q^3$, X^2 is, for example, a $OC(R^6)_2$ linking group, it is the oxygen atom, not the carbon atom, of the $OC(R^6)_2$ linking group which is attached to the phenyl ring in the formula Ia and the carbon atom is attached to the Q^3 group. It is to be understood that when X^3 is $SO_2N(R^7)$, as defined hereinbefore, the sulphur atom of the $SO_2N(R^7)$ linking group is attached to the nitrogen atom in formulae 1b, 1c, 1d or 1e and the nitrogen atom of the $SO_2N(R^7)$ linking group is attached to Q^4 .

As defined hereinbefore, adjacent carbon atoms in any (2-6C)alkylene chain within a Q^1-Z - group may be optionally separated by the insertion into the chain of a group such as O, $CON(R^3)$ or $C\equiv C$. For example, insertion of a $C\equiv C$ group into the ethylene chain within a 2-morpholinoethoxy group gives rise to a 4-morpholinobut-2-ynyloxy group.

When, as defined hereinbefore, any CH_2 or CH_3 group within a Q^1-Z - group optionally bears on each said CH_2 or CH_3 group one or more halogeno or (1-6C)alkyl substituents, there are suitably 1 or 2 halogeno or (1-6C)alkyl substituents present on each said CH_2 group and there are suitably 1, 2 or 3 such substituents present on each said CH_3 group.

- 24 -

When, as defined hereinbefore, any CH₂ or CH₃ group within a Q¹-Z- group optionally bears on each said CH₂ or CH₃ group a substituent as defined hereinbefore, suitable substituents so formed include, for example, hydroxy-substituted heterocycl-
 (1-6C)alkoxy groups such as 2-hydroxy-3-piperidinopropoxy and 2-hydroxy-
 5 3-morpholinopropoxy, hydroxy-substituted heterocycl-
 (1-6C)alkylamino groups such as 2-hydroxy-3-piperidinopropylamino and 2-hydroxy-
 3-morpholinopropylamino, heterocycl-substituted (1-6C)alkylamino-(1-6C)alkyl groups
 such as 2-morpholinoethylaminomethyl, 2-piperazin-1-ylethylaminomethyl and
 3-morpholinopropylaminomethyl and halogen substituted alkyl groups, for example di-
 10 fluoromethyl and 2,2-difluoroethyl.

Similar considerations apply to the attachments and substitutions within the -X²-Q³
 and -X³-Q⁴ groups present in Q².

It is to be understood that when, as defined hereinbefore, any CH₂ or CH₃ group within
 a Q¹-Z- group optionally bears on each said CH₂ or CH₃ group a substituent as defined
 15 hereinbefore, the optional substituent may be present on any CH₂ or CH₃ group within a Q¹-Z-
 group, including those on the hereinbefore defined substituents that may be present on an aryl,
 heteroaryl or heterocycl groups within Q¹-Z-. For example, if Q¹ is a
 1-(1-6C)alkyl-piperidin-4-yl group, the (1-6C)alkyl group may be optionally substituted by,
 for example a (2-6C)alkanoyl group to give a 1-((2-6C)alkanoyl-(1-6C)alkyl)-piperidin-4-yl
 20 group such as 1-(acetylmethyl)piperidin-4-yl or 1-(2-acetylethyl)piperidin-4-yl. Other suitable
 groups that may be so formed by Q¹ include, (1-6C)alkoxycarbonyl-(1-6C)alkyl substituted
 heterocycl groups, such as 1-(methoxycarbonylmethyl)piperidin-4-yl or
 1-(2-methoxycarbonylethyl)piperidin-4-yl, carbamoyl-(1-6C)alkyl substituted heterocycl
 groups such as 1-(carbamoylmethyl)piperidin-4-yl, or (1-6C)alkoxy-(1-6C)alkyl substituted
 25 heterocycl groups, such as 1-(2-methoxyethyl)piperidin-4-yl.

- 30 A quinazoline derivative of the Formula I, or a pharmaceutically-acceptable salt thereof, may be prepared by any process known to be applicable to the preparation of chemically-related compounds. Such processes, when used to prepare a quinazoline derivative of the Formula I are provided as a further feature of the invention and are illustrated

by the following representative process variants in which, unless otherwise stated, Q^1 , Z, R^1 and Q^2 have any of the meanings defined hereinbefore. Necessary starting materials may be obtained by standard procedures of organic chemistry. The preparation of such starting materials is described in conjunction with the following representative process variants and

5 within the accompanying Examples. Alternatively necessary starting materials are obtainable by analogous procedures to those illustrated which are within the ordinary skill of an organic chemist.

Process (a) The reaction, conveniently in the presence of a suitable base, of a quinazoline of the Formula II

II

10 wherein L^1 is a displaceable group and Q^1 and Z have any of the meanings defined hereinbefore except that any functional group is protected if necessary, with a compound of the Formula

15 wherein Q^2 and R^1 have any of the meanings defined hereinbefore except that any functional group is protected if necessary, whereafter any protecting group that is present is removed by conventional means.

A suitable base is, for example, an organic amine base such as, for example, pyridine, 2,6-lutidine, collidine, 4-dimethylaminopyridine, triethylamine, di-isopropylethylamine,

20 N-methylmorpholine or diazabicyclo[5.4.0]undec-7-ene, or, for example, an alkali or alkaline earth metal carbonate, for example sodium carbonate, potassium carbonate, calcium carbonate, or, for example, an alkali metal hydride, for example sodium hydride.

A suitable displaceable group L^1 is, for example, a halogeno, alkoxy, aryloxy, mercapto, alkylthio, arylthio, alkylsulphinyl, arylsulphinyl, alkylsulphonyl, arylsulphonyl or

25 sulphonyloxy group, for example a chloro, bromo, methoxy, phenoxy, pentafluorophenoxy, methylthio, methanesulphonyl, methanesulphonyloxy or toluene-4-sulphonyloxy group. The reaction is conveniently carried out in the presence of a suitable inert solvent or diluent, for example an alcohol or ester such as methanol, ethanol, isopropanol or ethyl acetate, a halogenated solvent such as methylene chloride, chloroform or carbon tetrachloride, an ether

such as tetrahydrofuran or 1,4-dioxan, an aromatic solvent such as toluene, or a dipolar aprotic solvent such as N,N-dimethylformamide, N,N-dimethylacetamide, N-methylpyrrolidin-2-one or dimethylsulphoxide. The reaction is conveniently carried out at a temperature in the range, for example, 10 to 250°C, conveniently in the range 40 to 80°C.

5 The quinazoline of the Formula II may also be reacted with a compound of the formula Q^2NHR^1 in the presence of a protic solvent such as isopropanol, conveniently in the presence of an acid, for example hydrogen chloride gas in diethyl ether or dioxane, or hydrochloric acid. Alternatively, this reaction may be conveniently carried out in an aprotic solvent, such as dioxane or a dipolar aprotic solvent such as N,N-dimethylacetamide in the presence of an
10 acid, for example hydrogen chloride gas in diethyl ether or dioxane, or hydrochloric acid. The above reactions are conveniently carried out at a temperature in the range, for example, 0 to 150°C, preferably at or near the reflux temperature of the reaction solvent.

The quinazoline derivative of the Formula II, wherein L^1 is halogeno, may be reacted with a compound of the formula Q^2NHR^1 in the absence of an acid or a base. In this reaction
15 displacement of the halogeno leaving group L^1 results in the formation of the acid HL^1 in-situ and the autocatalysis of the reaction. Conveniently the reaction is carried out in a suitable inert organic solvent, for example isopropanol, dioxane or N,N-dimethylacetamide. Suitable conditions for this reaction are as described above.

The quinazoline derivative of the Formula I may be obtained from this process in the
20 form of the free base or alternatively it may be obtained in the form of a salt with the acid of the formula $H-L^1$ wherein L^1 has the meaning defined hereinbefore. When it is desired to obtain the free base from the salt, the salt may be treated with a suitable base, for example, an alkali or alkaline earth metal carbonate or hydroxide, for example sodium carbonate, potassium carbonate, calcium carbonate, sodium hydroxide or potassium hydroxide.

25 Protecting groups may in general be chosen from any of the groups described in the literature or known to the skilled chemist as appropriate for the protection of the group in question and may be introduced by conventional methods. Protecting groups may be removed by any convenient method as described in the literature or known to the skilled chemist as appropriate for the removal of the protecting group in question, such methods being chosen so
30 as to effect removal of the protecting group with minimum disturbance of groups elsewhere in the molecule.

Specific examples of protecting groups are given below for the sake of convenience, in which "lower", as in, for example, lower alkyl, signifies that the group to which it is applied

preferably has 1-4 carbon atoms. It will be understood that these examples are not exhaustive. Where specific examples of methods for the removal of protecting groups are given below these are similarly not exhaustive. The use of protecting groups and methods of deprotection not specifically mentioned are, of course, within the scope of the invention.

5 A carboxy protecting group may be the residue of an ester-forming aliphatic or arylaliphatic alcohol or of an ester-forming silanol (the said alcohol or silanol preferably containing 1-20 carbon atoms). Examples of carboxy protecting groups include straight or branched chain (1-12C)alkyl groups (for example isopropyl, and tert-butyl); lower alkoxy- lower alkyl groups (for example methoxymethyl, ethoxymethyl and
10 isobutoxymethyl); lower acyloxy-lower alkyl groups, (for example acetoxymethyl, propionyloxymethyl, butyryloxymethyl and pivaloyloxymethyl); lower alkoxycarbonyloxy-lower alkyl groups (for example 1-methoxycarbonyloxyethyl and 1-ethoxycarbonyloxyethyl); aryl-lower alkyl groups (for example benzyl, 4-methoxybenzyl, 2-nitrobenzyl, 4-nitrobenzyl, benzhydryl and phthalidyl); tri(lower alkyl)silyl groups (for
15 example trimethylsilyl and tert-butyldimethylsilyl); tri(lower alkyl)silyl-lower alkyl groups (for example trimethylsilylethyl); and (2-6C)alkenyl groups (for example allyl). Methods particularly appropriate for the removal of carboxyl protecting groups include for example acid-, base-, metal- or enzymically-catalysed cleavage.

Examples of hydroxy protecting groups include lower alkyl groups (for example
20 tert-butyl), lower alkenyl groups (for example allyl); lower alkanoyl groups (for example acetyl); lower alkoxycarbonyl groups (for example tert-butoxycarbonyl); lower alkenyloxycarbonyl groups (for example allyloxycarbonyl); aryl-lower alkoxycarbonyl groups (for example benzyloxycarbonyl, 4-methoxybenzyloxycarbonyl, 2-nitrobenzyloxycarbonyl and 4-nitrobenzyloxycarbonyl); tri(lower alkyl)silyl (for example
25 trimethylsilyl and tert-butyldimethylsilyl) and aryl-lower alkyl (for example benzyl) groups.

Examples of amino protecting groups include formyl, aryl-lower alkyl groups (for example benzyl and substituted benzyl, 4-methoxybenzyl, 2-nitrobenzyl and 2,4-dimethoxybenzyl, and triphenylmethyl); di-4-anisylmethyl and furylmethyl groups; lower alkoxycarbonyl (for example tert-butoxycarbonyl); lower alkenyloxycarbonyl (for example
30 allyloxycarbonyl); aryl-lower alkoxycarbonyl groups (for example benzyloxycarbonyl, 4-methoxybenzyloxycarbonyl, 2-nitrobenzyloxycarbonyl and 4-nitrobenzyloxycarbonyl); lower alkanoyloxyalkyl groups (for example pivaloyloxymethyl); trialkylsilyl (for example

trimethylsilyl and tert-butyldimethylsilyl); alkylidene (for example methyldiene) and benzylidene and substituted benzylidene groups.

Methods appropriate for removal of hydroxy and amino protecting groups include, for example, acid-, base-, metal- or enzymically-catalysed hydrolysis for groups such as 2-nitrobenzyloxycarbonyl, hydrogenation for groups such as benzyl and photolytically for groups such as 2-nitrobenzyloxycarbonyl. For example a tert butoxycarbonyl protecting group may be removed from an amino group by an acid catalysed hydrolysis using trifluoroacetic acid.

Green *et al.*, also published by John Wiley & Son, for general guidance on protecting groups.

Quinazoline starting materials of the Formula II may be obtained by conventional procedures. For example, a 3,4-dihydroquinazolin-4-one of Formula III

wherein Q¹ and Z have any of the meanings defined hereinbefore except that any functional group is protected if necessary, may be reacted with a halogenating agent such as thionyl chloride, phosphoryl chloride or a mixture of carbon tetrachloride and triphenylphosphine whereafter any protecting group that is present is removed by conventional means. The reaction is conveniently carried out in a suitable inert solvent, for example 1,2-dichloroethane or N,N-dimethylformamide conveniently in the presence of an base such as an organic base, for example di-isopropylethylamine. The reaction is conveniently carried out at a temperature in the range, for example, 0 to 150°C, preferably at or near the reflux temperature of the reaction solvent.

The 4-chloroquinazoline so obtained may be converted, if required, into a 4-pentafluorophenoxyquinazoline by reaction with pentafluorophenol in the presence of a suitable base such as potassium carbonate and in the presence of a suitable solvent such as N,N-dimethylformamide.

The compound of Formula I may be also be prepared using a telescoped process stating from the compound of Formula III, wherein the compound of the Formula Q^2NHR^1 is reacted with the compound of Formula II following halogenation of the compound of Formula III. The use of such a telescoped process avoids the need to isolate the compound of Formula II prior to reaction with the compound of formula Q^2NHR^1 .

The 3,4-dihydroquinazolin-4-one of Formula III may be obtained using conventional procedures. For example when Z is an oxygen atom the compound of Formula III may be prepared as illustrated by Reaction Scheme 1 starting with the compound of Formula IV.

Reaction Scheme 1

10

wherein Q^1 is as hereinbefore defined, X is (1-6C)alkyl (for example methyl) or benzyl, and Pg is a suitable amine protecting group.

15 Notes:

Step (1)

When X is (1-6C)alkyl, it may be may be cleaved from the compound of formula IV by conventional methods, such as by treatment of the compound of Formula IV with, for example:

- 20 (i) an alkali metal (1-6C)alkylsulphide such as sodium ethanethiolate;
 (ii) an alkali metal diarylphosphide such as lithium diphenylphosphide;
 (iii) a boron or aluminium trihalide such as boron tribromide;
 (iv) magnesium bromide in pyridine; or
 (v) pyridine hydrochloride in pyridine.

Generally the cleavage reaction is carried out at a temperature in the range of from, for example, 40 to 150°C.

When X is benzyl, it may be may be cleaved from the compound of formula IV by, for example, acid catalysed hydrolysis, for example by treatment of the compound of Formula IV

Step (2)

The protecting group Pg is added to the 3,4-dihydro-5-hydroxyquinazolin-4-one of
Formula IVa using conventional techniques. For example a suitable Pg is a

Step (3)

The Q¹O group may be introduced by coupling the compound of Formula IVb with a
15 compound of the Formula Q¹OH in the presence of a suitable dehydrating agent. Suitable conditions for the coupling reaction are described below with reference to process (b).

Step (4)

The protecting group Pg may be removed using conventional methods, for example
when Pg is a pivaloyloxymethyl group it may be removed by treating the compound of
20 Formula IVc with a methanolic ammonia solution.

The compound of formula IV may, for example, be prepared starting from an aniline of the Formula V as illustrated in Reaction Scheme 2.

Reaction Scheme 2

wherein X is as hereinbefore defined.

Notes:

Steps 1 and 2 may be carried out using analogous conditions to the processes described in Organic Syntheses, Coll. Vol. 1, p 327-330; J. Org. Chem. 1969, 34, 3484-3489.

- 5 Step 3 may be carried out using analogous conditions to the process described in J. Org. Chem. 1952, 17, 141-148; J. Med. Chem. 1994, 37, 2106-2111.

Anilines of Formula V are commercially available compounds, or they are known in the literature, or can be prepared using well known processes in the art.

- In an alternative process the compound of formula III may be obtained according to
10 Reaction Scheme 1a:

Reaction Scheme 1a

- The reaction is conveniently performed in the presence of a suitable base. Suitable bases are
15 as herein described under process (a), for example sodium hydride. The reaction is conveniently performed in a suitable inert solvent, for example N,N-dimethylacetamide. Reaction Scheme 1a is particularly suitable for the preparation of compounds of the formula III in which Z is O. The 5-fluoro-3,4-dihydroquinazoline starting material is commercially available or can be prepared using conventional methods, for example as described in J. Org.
20 Chem. 1952, 17, 164-176.

Compounds of the Formula Q^2NHR^1 are commercially available compounds, or they are known in the literature, or can be prepared using conventional synthetic methods. For example when Q^2 is a group of the formula Ia the compound of the formula Q^2NHR^1 may be prepared in accordance with Reaction Scheme 3 or Reaction Scheme 4.

Reaction Scheme 3

wherein X^2 is as hereinbefore defined, for example, NR^6 , S, O or $\text{NR}^6\text{C}(\text{R}^6)_2$ and $\text{G}^1, \text{G}^2, \text{G}^6,$
 5 $\text{G}^7, \text{L}^1, \text{Q}^3$ and R^6 are as hereinbefore defined, except any functional group is protected if
 necessary, and whereafter any protecting group that is present is removed by conventional
 means.

Notes

Step 1 may be performed under analogous conditions to those used in process (a)
 10 described above. The compounds of the formula HX^2Q^3 are commercially available, or they
 are known in the literature, or can be prepared using well known processes in the art.

The reduction of the nitro group in step 2 may be carried out under standard
 conditions, for example by catalytic hydrogenation over a platinum/carbon, palladium/carbon
 or nickel catalyst, treatment with a metal such as iron, titanium chloride, tin II chloride or
 15 indium, or treatment with another suitable reducing agent such as sodium dithionite.

In an variation of process (a) the reduction of the nitro-compound in step 2 of reaction
 scheme 3 may be carried out as described above, followed directly with reaction with the
 compound of of formula II in a telescoped process, thereby avoiding the need to isolate the
 compound of the formula Q^2NHR^1 .

20 When Q^2 is a compound of the formula 1a in which X^2 is OCH_2 compounds of the
 formula Q^2NHR^1 may, for example, be prepared by reacting the starting nitro compound
 shown in Reaction Scheme 3 in which L^1 is OH with a compound of the formula Q^3CH_2 -
 halide (for example Q^3CH_2 -bromide). The nitro group may then be reduced to an amino
 group by using step 2 of the process in Reaction Scheme 3. Such compounds may also be
 25 prepared by reacting the starting nitro compound shown in Reaction Scheme 3 in which L^1 is
 halide with a compound of the formula $\text{Q}^3\text{CH}_2\text{OH}$, followed by reduction of the nitro group as
 described above in Reaction Scheme 3.

Compounds of the formula Q^3CH_2OH are known or may be prepared using known methods, for example by reduction of the corresponding ester of the formula Q^3COOR , wherein R is, for example (1-6C)alkyl, or benzyl, with a suitable reducing agent, for example sodium borohydride.

- 5 When Q^2 is a compound of the formula 1a in which X^2 is OCH_2 compounds of the formula Q^2NHR^1 may, for example, be prepared by coupling the starting nitro compound shown in Reaction Scheme 3 in which L^1 is OH with a compound of the formula Q^3CH_2OH , conveniently in the presence of a suitable dehydrating agent. Suitable conditions for performing this reaction are analogous to those described below in relation to Process(b).

10

When Q^2 is a compound of the formula 1a in which X^2 is $C(R^6)_2NR^6$ or $NR^6C(R^6)_2$ compounds of the formula Q^2NHR^1 may, for example, be prepared according to Reaction Scheme 3a:

Reaction Scheme 3a

15

- wherein $G^1, G^2, G^6, G^7, L^1, Q^3$ and R^6 are as hereinbefore defined, except any functional group is protected if necessary, and whereafter any protecting group that is present is removed by conventional means. The first step of Reaction Scheme 3a may be performed under analogous conditions to those used in process (a) described above. The starting nitro compounds and the compounds of the formula Q^3NR^6H and $Q^3C(R^6)_2L^1$ are commercially available, or they are known in the literature, or can be prepared using well known processes in the art. The reduction of the nitro group in step 2 may be carried out under analogous conditions to those described above for Reaction Scheme 3.

Reaction Scheme 4

wherein $\text{G}^1, \text{G}^2, \text{G}^6, \text{G}^7, \text{Q}^3$ and R^6 are as hereinbefore defined, except any functional group is protected if necessary, and whereafter any protecting group that is present is removed by conventional means, and L^1 is a suitable leaving group such as halide, for example chloro.

Notes

Suitable for the preparation of those compounds wherein X^2 is CO or CH_2NR^6 .

Step 1 may be carried out under analogous conditions to those used in process (a) described above.

The reduction of the nitro group in step 2 may be carried out as described above in Reaction Scheme 3.

When Q^2 is a compounds of the formula Ia in which X^2 is CO and Q^3 is a nitrogen containing heterocyclyl group linked to X^2 by a nitrogen atom, the compound of the formula Q^2NHR^1 may be prepared by coupling the starting nitro compound shown in Reaction Scheme 3 in which L^1 is carboxy with a compound of the formula Q^3H in the presence of a suitable coupling agent, for example O-(7-azabenzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluoro-phosphate (HATU). Suitable conditions for this reaction are analogous to those described in relation to process (j) below.

When Q^2 is a compound of the formula Ib, Ic, Id and Ie, the compound of the formula Q^2NHR^1 may be prepared, for example, by reacting an appropriate nitro-indole or nitro indazole with a compound of the formula Q^4X^3 -halide, suitably in the presence of a base. The reaction is conveniently carried out in a suitable inert solvent, under analogous conditions to those described for Process (a). The nitro group on the resulting indole or indazole may then be reduced to an amino group using an analogous process to that described in step 2 in Reaction Scheme 3.

Process (b) For the production of those compounds of the Formula I wherein Z is an oxygen atom, the coupling, conveniently in the presence of a suitable dehydrating agent, of an alcohol of the Formula

The reaction is conveniently carried out in the presence of a suitable inert

The quinazoline of the Formula VI may be obtained by conventional procedures. For example, by cleavage of the group represented by X from the compound of the Formula VII

20

VII

wherein X is as defined hereinbefore and R¹ and Q² have any of the meanings defined hereinbefore except that any functional group is protected if necessary, whereafter any protecting group that is present is removed by conventional means.

The cleavage reaction is conveniently carried out as hereinbefore described in relation to step (1) in Reaction Scheme 1.

The compound of Formula VII may be prepared by for example reacting the compound of the Formula (IV) as hereinbefore defined, with a halogenating agent such as thionyl chloride, phosphoryl chloride or a mixture of carbon tetrachloride and triphenylphosphine. The resulting compound is then reacted with a compound of the Formula

Biological Assays

- 5 The inhibitory activities of compounds were assessed in non-cell based protein tyrosine kinase assays as well as in cell based proliferation assays before their *in vivo* activity was assessed in Xenograft studies.

a) Protein Tyrosine Kinase phosphorylation Assays

- 10 This test measures the ability of a test compound to inhibit the phosphorylation of a tyrosine containing polypeptide substrate by an enzyme selected from the EGFR kinase, erbB2 kinase and erb4 kinase.

- Recombinant intracellular fragments of EGFR, erbB2 and erbB4 (accession numbers X00588, X03363 and L07868 respectively) were cloned and expressed in the baculovirus/Sf21 system. Lysates were prepared from these cells by treatment with ice-cold
15 lysis buffer (20mM N-2-hydroxyethylpiperazine-N'-2-ethanesulphonic acid (HEPES) pH7.5, 150mM NaCl, 10% glycerol, 1% Triton X-100, 1.5mM MgCl₂, 1mM ethylene glycol-bis(β-aminoethyl ether) N',N',N',N'-tetraacetic acid (EGTA), plus protease inhibitors and then cleared by centrifugation.

- Constitutive kinase activity of these recombinant proteins was determined by their
20 ability to phosphorylate a synthetic peptide (made up of a random co-polymer of Glutamic Acid, Alanine and Tyrosine in the ratio of 6:3:1). Specifically, Maxisorb™ 96-well immunoplates were coated with synthetic peptide (0.2μg of peptide in a 200μl phosphate buffered saline (PBS) solution and incubated at 4°C overnight). Plates were washed in 50mM HEPES pH 7.4 at room temperature to remove any excess unbound synthetic peptide. EGFR,
25 erbB2 or erbB4 activities were assessed by incubation in peptide coated plates for 20 minutes at room temperature in 100mM HEPES pH 7.4 at room temperature, adenosine trisphosphate (ATP) at Km concentration for the respective enzyme, 10mM MnCl₂, 0.1mM Na₃VO₄, 0.2mM DL-dithiothreitol (DTT), 0.1% Triton X-100 with test compound in DMSO (final concentration of 2.5%). Reactions were terminated by the removal of the liquid components
30 of the assay followed by washing of the plates with PBS-T (phosphate buffered saline with 0.5% Tween 20).

The immobilised phospho-peptide product of the reaction was detected by immunological methods. Firstly, plates were incubated for 90 minutes at room temperature with anti-phosphotyrosine primary antibodies that were raised in the mouse (4G10 from Upstate Biotechnology). Following extensive washing, plates were treated with Horseradish Peroxidase (HRP) conjugated sheep anti-mouse secondary antibody (NXA931 from Amersham) for 60 minutes at room temperature. After further washing, HRP activity in each well of the plate was measured colorimetrically using 22'-Azino-di-[3-ethylbenzthiazoline sulphonate (6)] diammonium salt crystals (ABTS™ from Roche) as a substrate.

Quantification of colour development and thus enzyme activity was achieved by the measurement of absorbance at 405nm on a Molecular Devices ThermoMax microplate reader. Kinase inhibition for a given compound was expressed as an IC₅₀ value. This was determined by calculation of the concentration of compound that was required to give 50% inhibition of phosphorylation in this assay. The range of phosphorylation was calculated from the positive (vehicle plus ATP) and negative (vehicle minus ATP) control values.

15 b) KB cell proliferation assay

This assay measures the ability of a test compound to inhibit the proliferation of KB cells (human naso-pharyngeal carcinoma obtained from the American Type Culture Collection (ATCC)).

KB cells (human naso-pharyngeal carcinoma obtained from the ATCC) were cultured in Dulbecco's modified Eagle's medium (DMEM) containing 10% foetal calf serum, 2 mM glutamine and non-essential amino acids at 37°C in a 7.5% CO₂ air incubator. Cells were harvested from the stock flasks using Trypsin/ethylaminediaminetetraacetic acid (EDTA). Cell density was measured using a haemocytometer and viability was calculated using trypan blue solution before being seeded at a density of 1.25x10³ cells per well of a 96 well plate in DMEM containing 2.5% charcoal stripped serum, 1mM glutamine and non-essential amino acids at 37°C in 7.5% CO₂ and allowed to settle for 4 hours.

Following adhesion to the plate, the cells are treated with or without EGF (final concentration of 1ng/ml) and with or without compound at a range of concentrations in dimethylsulphoxide (DMSO) (1% final) before incubation for 4 days. Following the incubation period, cell numbers were determined by removal of the media by aspiration and incubating with 50µl of 3-(4,5-Dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT)

(stock 5mg/ml) for 2 hours. MTT solution was then removed by aspiration, allowed to air dry and the cells dissolved upon the addition of 100µl of DMSO.

Absorbance of this solubilised cells was read at 540nm to quantify cell biomass.

Inhibition of proliferation was expressed as an IC₅₀ value. This was determined by calculation of the concentration of compound that was required to give 50% inhibition of proliferation. The range of proliferation was calculated from the positive (vehicle plus EGF) and negative (vehicle minus EGF) control values.

c) H16N-2 cell proliferation assay

Tumour progression in breast cancer. In: J. S. Rhim and A. Dritschilo (eds.), *Neoplastic Transformation in human Cell Culture*, pp 169-178. Clifton, NJ: Humana Press, 1991) and were obtained from the Dana-Farber Cancer Institute, 44 Binney Street, Boston, Massachusetts 02115.

H16N-2 cells were routinely cultured in culture medium (a 1:1 mix of Gibco F12 and Ham's αMEM media containing 1 % foetal calf serum, 10mM HEPES, 1µg/ml Insulin, 12.5ng/ml EGF; 2.8µM Hydrocortisone, 2nM Estradiol 5µM Ascorbic Acid, 10µg/ml Transferrin, 0.1mM Phosphoethanolamine, 15nM Sodium Selenite, 2mM Glutamine, 10nM Tri-iodo-thyrone, 35µg/ml Bovine pituitary Extract and 0.1mM Ethanolamine) at 37°C in a 7.5% CO₂ air incubator. Cells were harvested from the stock flasks using Trypsin/ethylaminediaminetetraacetic acid (EDTA). Cell density was measured using a haemocytometer and viability was calculated using trypan blue solution before being seeded at a density of 1.0x10³ cells per well of a 96 well plate in the above media at 37°C in 7.5% CO₂ and allowed to settle for 72 hours.

Following this, the cells were starved of serum for 24 hours upon the addition of starvation medium (a 1:1 mix of Gibco F12 and Ham's αMEM media containing, 10mM HEPES, 2nM Estradiol, 5µM Ascorbic Acid, 10µg/ml Transferrin, 0.1mM Phosphoethanolamine, 15nM Sodium Selenite, 2mM Glutamine, and 0.1mM Ethanolamine) and incubated at 37°C in 7.5% CO₂. The cells were then treated with or without compound at a range of concentrations in dimethylsulphoxide (DMSO) (1% final) for two hours before the

addition of exogenous ligand (at a final concentration of 100ng/ml of heregulin β or 5ng/ml of EGF) and incubation with both ligand and compound for 4 days at 37°C in 7.5% CO₂.

Following the incubation period, cell numbers were determined by removal of the media by aspiration and incubating with 50 μ l of 3-(4,5-Dimethylthiazol-2-yl)-2, 5-diphenyltetrazolium bromide (MTT) (stock 5mg/ml) for 2 hours. MTT solution was then removed by aspiration, allowed to air dry and the cells dissolved upon the addition of 100 μ l of DMSO.

Absorbance of this solubilised cells was read at 540nm to quantify cell biomass.

Inhibition of proliferation was expressed as an IC₅₀ value. This was determined by calculation of the concentration of compound that was required to give 50% inhibition of proliferation.

The range of proliferation was calculated from the positive (vehicle plus ligand) and negative (vehicle minus ligand) control values.

d) *In vivo* LoVo Xenograft assay

This assay measures the ability of a test compound to inhibit the growth of a LoVo tumour cell xenograft (colorectal adenocarcinoma obtained from the ATCC) in Female Swiss athymic mice (Alderley Park, *nu/nu* genotype).

Female Swiss athymic (*nu/nu* genotype) mice were bred and maintained in Alderley Park in negative pressure Isolators (PFI Systems Ltd.). Mice were housed in a barrier facility with 12hr light/dark cycles and provided with sterilised food and water *ad libitum*. All procedures were performed on mice of at least 8 weeks of age. LoVo tumour cell xenografts were established in the hind flank of donor mice by sub-cutaneous injections of 1x10⁷ freshly cultured cells in 100 μ l of serum free media per animal. On day 5 post-implant, mice were randomised into groups of 7 prior to the treatment with compound or vehicle control that was administered once daily at 0.1ml/kg body weight. Tumour volume was assessed twice weekly by bilateral Vernier calliper measurement, using the formula (length x width) x $\sqrt{(\text{length} \times \text{width}) \times (\pi/6)}$, where length was the longest diameter across the tumour, and width was the corresponding perpendicular. Growth inhibition from start of treatment was calculated by comparison of the mean changes in tumour volume for the control and treated groups, and statistical significance between the two groups was evaluated using a Students *t* test.

e) *In vivo* BT-474 Xenograft assay

athymic mice (Alderley Park, *nu/nu* genotype) (Baselga, J. *et al.* (1998) *Cancer Research*, **58**, 2825-2831).

Female Swiss athymic (*nu/nu* genotype) mice were bred and maintained in Alderley Park in negative pressure Isolators (PFI Systems Ltd.). Mice were housed in a barrier facility
5 with 12hr light/dark cycles and provided with sterilised food and water *ad libitum*. All procedures were performed on mice of at least 8 weeks of age. BT-474 tumour cell xenografts were established in the hind flank of donor mice by sub-cutaneous injections of 1×10^7 freshly cultured cells in 100 μ l of serum free media with 50% Matrigel per animal. On day 14 post-implant, mice were randomised into groups of 10 prior to the treatment with
10 compound or vehicle control that was administered once daily at 0.1ml/kg body weight. Tumour volume was assessed twice weekly by bilateral Vernier calliper measurement, using the formula $(\text{length} \times \text{width}) \times \sqrt{(\text{length} \times \text{width}) \times (\pi/6)}$, where length was the longest diameter across the tumour, and width was the corresponding perpendicular. Growth inhibition from start of treatment was calculated by comparison of the mean changes in

Although the pharmacological properties of the compounds of the Formula I vary with structural change as expected, in general activity possessed by compounds of the Formula I, may be demonstrated at the following concentrations or doses in one or more of the above
20 tests (a), (b), (c), (d) and (e):-

- Test (a):- IC_{50} in the range, for example, 0.001 - 10 μ M;
- Test (b):- IC_{50} in the range, for example, 0.001 - 20 μ M;
- Test (c):- IC_{50} in the range, for example, 0.001 - 20 μ M;
- Test (d):- activity in the range, for example, 1-200 mg/kg/day;
- 25 Test (e):- activity in the range, for example, 1-200 mg/kg/day;

No physiologically unacceptable toxicity was observed in Test (d) or (e) at the effective dose for compounds tested of the present invention. Accordingly no untoward toxicological effects are expected when a compound of Formula I, or a pharmaceutically-acceptable salt thereof, as defined hereinbefore is administered at the dosage
30 ranges defined hereinafter.

According to a further aspect of the invention there is provided a pharmaceutical composition which comprises a quinazoline derivative of the Formula I, or a

- 108 -

pharmaceutically-acceptable thereof, as defined hereinbefore in association with a pharmaceutically-acceptable diluent or carrier.

The compositions of the invention may be in a form suitable for oral use (for example as tablets, lozenges, hard or soft capsules, aqueous or oily suspensions, emulsions, dispersible
5 powders or granules, syrups or elixirs), for topical use (for example as creams, ointments, gels, or aqueous or oily solutions or suspensions), for administration by inhalation (for example as a finely divided powder or a liquid aerosol), for administration by insufflation (for example as a finely divided powder) or for parenteral administration (for example as a sterile aqueous or oily solution for intravenous, subcutaneous, intramuscular or intramuscular dosing
10 or as a suppository for rectal dosing).

The compositions of the invention may be obtained by conventional procedures using conventional pharmaceutical excipients, well known in the art. Thus, compositions intended for oral use may contain, for example, one or more colouring, sweetening, flavouring and/or preservative agents.

15 The amount of active ingredient that is combined with one or more excipients to produce a single dosage form will necessarily vary depending upon the host treated and the particular route of administration. For example, a formulation intended for oral administration to humans will generally contain, for example, from 0.5 mg to 0.5 g of active agent (more suitably from 0.5 to 100 mg, for example from 1 to 30 mg) compounded with an
20 appropriate and convenient amount of excipients which may vary from about 5 to about 98 percent by weight of the total composition.

The size of the dose for therapeutic or prophylactic purposes of a compound of the Formula I will naturally vary according to the nature and severity of the conditions, the age and sex of the animal or patient and the route of administration, according to well known
25 principles of medicine.

In using a compound of the Formula I for therapeutic or prophylactic purposes it will generally be administered so that a daily dose in the range, for example, 0.1 mg/kg to 75 mg/kg body weight is received, given if required in divided doses. In general lower doses will be administered when a parenteral route is employed. Thus, for example, for intravenous
30 administration, a dose in the range, for example, 0.1 mg/kg to 30 mg/kg body weight will generally be used. Similarly, for administration by inhalation, a dose in the range, for example, 0.05 mg/kg to 25 mg/kg body weight will be used. Oral administration is however

preferred, particularly in tablet form. Typically, unit dosage forms will contain about 0.5 mg to 0.5 g of a compound of this invention.

We have found that the compounds of the present invention possess anti-proliferative properties such as anti-cancer properties that are believed to arise from their erbB family
5 receptor tyrosine kinase inhibitory activity, particularly inhibition of the EGFR and/or erbB2 and/or erbB4 receptor tyrosine kinases, and especially the selective inhibition of erbB2 receptor tyrosine kinases. Accordingly the compounds of the present invention are expected to be useful in the treatment of diseases or medical conditions mediated alone or in part by erbB receptor tyrosine kinases, i.e. the compounds may be used to produce a erbB receptor
10 tyrosine kinase inhibitory effect in a warm-blooded animal in need of such treatment. Thus the compounds of the present invention provide a method for the treatment of malignant cells characterised by inhibition of one or more of the erbB family of receptor tyrosine kinases. Particularly the compounds of the invention may be used to produce an anti-proliferative and/or pro-apoptotic and/or anti-invasive effect mediated alone or in part by the inhibition of
15 erbB receptor tyrosine kinases. Particularly, the compounds of the present invention are expected to be useful in the prevention or treatment of those tumours that are sensitive to inhibition of one or more of the erbB receptor tyrosine kinases, such as EGFR and/or erbB2 and/or erbB4 kinase that are involved in the signal transduction steps which drive proliferation and survival of these tumour cells. Accordingly the compounds of the present invention are
20 expected to be useful in the treatment and/or prevention of a number of hyperproliferative disorders by providing an anti-proliferative effect. These disorders include, for example psoriasis, benign prostatic hyperplasia (BPH), atherosclerosis and restenosis and, in particular, erbB2 receptor tyrosine kinase driven tumours. Such benign or malignant tumours may affect any tissue and include non-solid tumours such as leukaemia, multiple myeloma or lymphoma,
25 and also solid tumours, for example bile duct, bone, bladder, brain/CNS, breast, colorectal, endometrial, gastric, head and neck, hepatic, lung, neuronal, oesophageal, ovarian, pancreatic, prostate, renal, skin, testicular, thyroid, uterine and vulval cancers.

30 Thus according to this aspect of the invention there is provided the use of a quinazoline derivative of the formula I, or a pharmaceutically-acceptable salt thereof, as defined hereinbefore in the manufacture of a medicament for use in the production of an anti-proliferative effect in a warm-blooded animal such as man.

According to a further feature of this aspect of the invention there is provided a method for producing an anti-proliferative effect in a warm-blooded animal, such as man, in need of such treatment which comprises administering to said animal an effective amount of a quinazoline derivative of the formula I, or a pharmaceutically acceptable salt thereof, as
5 hereinbefore defined.

15 According to a further feature of this aspect of the invention there is provided a method for the prevention or treatment of those tumours which are sensitive to inhibition of one or more of the erbB family of receptor tyrosine kinases, such as EGFR and/or erbB2 and/or erbB4, that are involved in the signal transduction steps which lead to the proliferation and/or survival of tumour cells in a warm-blooded animal, such as man, in need of such
20 treatment, which comprises administering to said animal an effective amount of a quinazoline derivative of the Formula I, or a pharmaceutically-acceptable salt thereof, as defined hereinbefore.

According to a further aspect of the invention there is provided a compound of the formula I, or a pharmaceutically acceptable salt thereof, for use in the prevention or treatment
25 of those tumours which are sensitive to inhibition of one or more of the erbB family of receptor tyrosine kinases, such as EGFR and/or erbB2 and/or erbB4, that are involved in the signal transduction steps which lead to the proliferation and/or survival of tumour cells.

According to a further aspect of the invention there is provided the use of a quinazoline derivative of the Formula I, or a pharmaceutically-acceptable salt thereof, as
30 defined hereinbefore in the manufacture of a medicament for use in providing a EGFR and/or erbB2 and/or erbB4 kinase inhibitory effect.

According to a further feature of this aspect of the invention there is provided a method for providing a EGFR and/or an erbB2 and/or an erbB4 kinase inhibitory effect in a

warm-blooded animal, such as man, in need of such treatment, which comprises administering to said animal an effective amount of a quinazoline derivative of the Formula I, or a pharmaceutically-acceptable salt thereof, as defined hereinbefore.

According to a further feature of this aspect of the invention there is provided a method for providing a selective erbB2 kinase inhibitory effect in a warm-blooded animal, such as man, in need of such treatment, which comprises administering to said animal an effective amount of a quinazoline derivative of the Formula I, or a pharmaceutically-acceptable salt thereof, as defined hereinbefore.

According to a further aspect of the invention there is provided a compound of the formula I, or a pharmaceutically acceptable salt thereof, for use in providing a selective erbB2 kinase inhibitory effect.

By "a selective erbB2 kinase inhibitory effect" is meant that the quinazoline derivative of formula I is more potent against erbB2 receptor tyrosine kinase than it is against other kinases. In particular the quinazoline derivative of formula I is more potent against erbB2 receptor kinase than it is against EGFR tyrosine kinase. For example in a cellular assay (such as the H16N-2 assay described herein) the quinazoline derivative of formula I is at least 5 times, preferably at least 10 times more potent against erbB2 receptor tyrosine kinase driven proliferation than it is against EGFR tyrosine kinase driven proliferation, as determined from the relative IC₅₀ values

According to a further aspect of the present invention there is provided the use of a quinazoline derivative of the Formula I, or a pharmaceutically-acceptable salt thereof, as defined hereinbefore in the manufacture of a medicament for use in the treatment of a cancer selected from leukaemia, multiple myeloma, lymphoma, bile duct, bone, bladder, brain/CNS, breast, colorectal, endometrial, gastric, head and neck, hepatic, lung, neuronal, oesophageal, ovarian, pancreatic, prostate, renal, skin, testicular, thyroid, uterine and vulval cancer.

15 surgery or radiotherapy or chemotherapy. Such chemotherapy may include one or more of the following categories of anti-tumour agents:

characterisation by treating a solution of the salt in aqueous methanol with a base such as ammonium hydroxide or sodium bicarbonate thereby precipitating the free base, or by chromatography on silica using an eluant containing a base such as ammonia. 30 **Example 26**

The compounds in Table 1 were prepared as follows:

A stock solution of 4-(3-chloro-4-hydroxyanilino)-5-(1-methylpiperidin-4-yloxy)quinazoline (reference example 4.2) (335 mg) in DMF (7.92 ml) was prepared, and 100 μ l aliquots transferred to a 96 well plate. Using a resin loader, potassium carbonate (300mg) was distributed evenly across the plate. An appropriate benzyl or heteroarylmethyl chloride (0.11 mM) were dissolved in DMF (1 ml) and 100 μ l of each solution transferred to the plate. The plate was agitated at 25°C for 16 hours. To each well was added DMF (100 μ L) and trisamine scavenger resin (726 mg) by using the resin loader to distribute evenly across the wells. The plate was agitated for 3 hours at 25°C. Each well was filtered to remove resin and inorganic material and the remaining filtrates were concentrated *in vacuo*. DMSO (550 μ l) was added to each well and aliquots of 50 μ l were then taken from each well for LCMS purity determination. LCMS purity was determined on a Phenomenex Synergi column (reverse phase silica, 50 x 2 mm, flow rate 1.1 ml/minute), eluting with acetonitrile-water containing formic acid (0.05%) on a gradient from 5-95% over 4.5 minutes, with UV detection at 254 nm. There was thus obtained the compound shown in bold in Table 1.
